Motivic Chern classes of Schubert cells and applications.

joint works with P. Aluffi, L. Mihalcea, J. Schurmann

Plan: 0) Chern-Schwartz-MacPherson class in homology

1) Motivic Chern class in K-theory

2) Applications in p-adic group representations.

0) Chern-Schwartz-MacPherson class in homology

two functors: $\mathcal{F}(X)$ = constructible functions on an alg. variety $X/\mathbb{C}$
(can be singular).

$H_*(X)$ = Homology of X.

Thm (MacPherson).

$\exists!$ natural transformation

$$c_*: \mathcal{F} \to H_*,$$

s.t. if X is projective and smooth, $c_*(1_X) = c(TX) \cap [X]$.

$f: X \to Y$ proper,

$$\begin{tikzcd} \mathcal{F}(X) \arrow[r, "f_*"] \arrow[d, "c_*"'] \arrow[dr, phantom, "\circlearrowright"] & \mathcal{F}(Y) \arrow[d, dashed, "c_*"] \\ H_*(X) \arrow[r, "f_*"'] & H_*(Y) \end{tikzcd}$$

Notations:

G s.s. Lie group / $\mathbb{C}$. e.g. $SL(n, \mathbb{C})$

B - Borel subgp. $B = \left\{ \begin{pmatrix} * & \cdots & * \\ & \ddots & \vdots \\ & & * \end{pmatrix} \right\}$

T - max. torus. $T = \left\{ \begin{pmatrix} * & & \\ & \ddots & \\ & & * \end{pmatrix} \right\}$

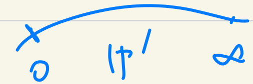
W - Weyl group $W = S_n$.

$X := G/B$ flag variety, $X = \{ F_\bullet = (F_1 \subseteq F_2 \subseteq \cdots \subseteq F_n = \mathbb{C}^n) \mid \dim F_i = i \}$

$w \in W$, $X(w)^\circ := BwB/B$ Schubert cell.

$X(w) := \overline{X(w)^\circ}$ Schubert variety.

Ex. $G = SL(2,\mathbb{C})$, $X = \mathbb{P}^1$,



$$c_*(1_{X(id)^\circ}) = [X(id)] = [0], \qquad c_*(1_{X(s_\alpha)^\circ}) = c_*(1_{\mathbb{P}^1}) - c_*(1_{X(id)^\circ}) = [\mathbb{P}^1] + [\infty]$$

Thm: ① (Aluffi-Mihalcea '16) $c_*(1_{X(w)^\circ})$ is generated by the degenerate Hecke operators.

(Aluffi-Mihalcea-Schürmann-S, 17)

② $i: X \hookrightarrow T^*X$,

(Rimanyi-Varchenko)

$$c_*(1_{X(w)^\circ}) = \pm i^*[\mathrm{char}(1_{X(w)^\circ})]\Big|_{\hbar=1} \overset{*}{=} \pm i^*\left(\begin{array}{c}\text{Maulik-Okounkov}\\ \text{stable envelope}\end{array}\right)\Bigg|_{\hbar=1}$$

equiv. parameter for $\mathbb{C}^* \circlearrowright T^*X$ dilation.

③ $c_*(1_{X(w)^\circ})$ is a positive class in $H^*(X)$. (conjectured by Aluffi-Mihalcea).

1) Motivic chern class in K-theory

- Definition.

two functors: $Y/\mathbb{C}$, $K^0(Var/Y) := \{[Z \xrightarrow{f} Y]\} / [Z \xrightarrow{f} Y] = [U \xrightarrow{f} Y] + [Z \setminus U \xrightarrow{f} Y]$

$U \subseteq Z$ open.

- $K(Y) := K^0(Coh(Y))$.

Thm (Brasselet-Schürmann-Yokura).

$\exists!$ natural transformation

$MC_y: K^0(Var/-) \to K(-)[y]$, s.t. if Y is smooth,

$MC_y([Y \xrightarrow{id} Y]) = \lambda_y(T^*Y) := \sum_i y^i [\Lambda^i T^*Y]$. Here y is a formal variable.

Remark: $\exists$ equivariant generalizations. (Fehér-Rimányi-Weber, Aluffi-Mihalcea-Schurmann-S.)

- Flag variety setting.

$T \curvearrowright X = G/B.$ $\quad K_T(X) := K^\circ(Coh_T(X)).$

$K_T(pt) = K^\circ(Coh_T(pt)) = K^\circ(Rep(T)) = \mathbb{Z}[T].$

Let $MC_y(X(w)^\circ) := MC_y([X(w)^\circ \hookrightarrow X]) \in K_T(X)[y].$

<u>Ex</u>. $G = SL(2, \mathbb{C}).$ $\quad MC_y(X(id)^\circ) = [\mathcal{O}_o]$

$MC_y(X(s_\alpha)^\circ) = MC_y(\mathbb{P}^1) - MC_y(X(id)^\circ) = \lambda_y(T^*\mathbb{P}^1) - [\mathcal{O}_o].$

6

Demazure operators.

α_i: simple root, $B \subseteq P_i$ minimal parabolic

e.g. $\alpha_i = \delta_i - \delta_{i+1}$

$$P_i = \left\{ \begin{pmatrix} * & & & & * \\ & \ddots & & & \\ & & * & & \\ & & {\color{red}*} & * & \\ & & & \ddots & \\ & & & & * \end{pmatrix} \right\}$$

$(i+1, i)$.

$\pi_i : G/B \to G/P_i$ BGG operator $\partial_i := \pi_i^* \pi_{i*} \curvearrowright K_T(X)$.

then $\partial_i^2 = \partial_i$, braid relation.

$$\partial_i([\mathcal{O}_{X(w)}]) = [\mathcal{O}_{X(ws_i)}] \quad \text{if } ws_i > w.$$

Demazure-Lusztig operator.

$\forall\ \lambda \in X^*(T)$, $\quad \mathcal{L}_\lambda := G\times_B \mathbb{C}_\lambda$

$$\downarrow$$

$$X$$

affine Hecke alg.

Let $T_i = (1+y\mathcal{L}_{\alpha_i})\partial_i - id$, $\quad (T_i+1)(T_i+y) = 0$, $\quad$ Braid relations.

Thm: (Aluffi-Mihalcea-Schurmann-S, 2019).

1). $T_i(\, MC_y(X(w)^\circ)\,) = MC_y(X(ws_i)^\circ)$ $\quad$ if $ws_i > w$.

2) $i: X \hookrightarrow T^*X$, $\quad MC_y(X(w)^\circ)$ " $=$ " $i^* gr[\mathbb{Q}^H_{X(w)^\circ}] = i^*\left(\begin{array}{l}\text{K-theoretic MO}\\ \text{stable envelope}\end{array}\right)$.

constant mixed Hodge module.

Feher-Rimanyi-Weber

• Smoothness Criterion.

Thm (Kumar). $u \le w \in W$

$$X(w) \text{ smooth at } uB \Leftrightarrow [X(w)]|_u = \prod_{\substack{\alpha>0 \\ ws_\alpha \not\le w}} (-u\alpha) \in H_T^*(pt).$$

$\cap$

$X(w)$

Thm: (Aluffi-Mihalcea-Schurmann-S, 2019).

$u \le w \in W$.

$$X(w) \text{ smooth at } uB \Leftrightarrow MC_y(X(w))|_u = \prod_{\substack{\alpha>0 \\ us_\alpha \not\le w}} (1-e^{u\alpha}) \cdot \prod_{\substack{\alpha>0 \\ us_\alpha \le w}} (1+ye^{u\alpha}).$$

($\Rightarrow$ use property of $MC_y(X(w)^\circ)$,

$\Leftarrow$ $y=0$, $MC_y(X(w)^\circ)|_{y=0} = [\mathcal{O}_{X(w)}(-\partial X(w))]$, take Chern character)

2) Applications in p-adic group representations.

- Bump-Nakasuji-Naruse conj.

F non-archimedean local field. $\mathcal{O}_F \subseteq F$, k_F = residue field $= \mathbb{F}_q$, a finite field.

$G^\vee$ = Langlands dual group $/F$., $T^\vee \leq B^\vee \leq G^\vee$, I = Iwahori-subgroup,

$$\begin{array}{ccc} I & \leq & G^\vee(\mathcal{O}_F) \\ \downarrow & & \downarrow \\ B^\vee(k_F) & \leq & G^\vee(k_F) \end{array}$$

τ — an unramified char. of $T^\vee$ ($\Leftrightarrow \tau \in T$)

Principal series representation $\mathrm{Ind}_{B^\vee(F)}^{G^\vee(F)}(\tau) \circlearrowleft G^\vee(F)$.

Iwahori-Hecke alg.

Let $I(\tau) := \left(\mathrm{Ind}_{B^\vee(F)}^{G^\vee(F)}(\tau)\right)^I \circlearrowleft \mathbb{C}_c[I \backslash G^\vee(F) / I]$

Two bases in $I(\tau)$: ① $\{\varphi_w \mid w \in W\}$, $\varphi_w = 1_{B^\vee(F) w I}$.

② $\{f_w \mid w \in W\}$ Casselman basis (defined using the intertwiners; eigenbasis for the lattice part of the Iwahori-Hecke alg).

define matrix coefficients $m_{u,w}$ by

$$\phi_u := \sum_{w \geq u} \varphi_w = \sum m_{u,w} \cdot f_w$$

Gindikin-Karpelevich formula: $$m_{id,w} = \prod_{\substack{\alpha > 0 \\ s_\alpha w < w}} \frac{1 - q^{-1} e^{\alpha}(\tau)}{1 - e^{\alpha}(\tau)}.$$

Let $w_0 \in W$ be the longest element.

Conj (Bump-Nakasuji)

Assume the Dynkin diagram of G is simply-laced.

1). For any $u \le w \in W$, the Kazhdan-Lusztig poly. $P_{w_0w^{-1}, w_0u^{-1}}(q) = 1$

$$\Longleftrightarrow \quad m_{u,w} = \prod_{\substack{\alpha>0 \\ u \le s_\alpha w < w}} \frac{1-q^{-1}e^{\alpha}(\tau)}{1-e^{\alpha}(\tau)}.$$

2). $\prod_{\substack{\alpha>0 \\ u \le s_\alpha w < w}} (1-e^{\alpha}) \cdot m_{u,w}$ has no pole on $T(\mathbb{C})$.

Refinement (Naruse). Remove the condition: "G is simply-laced",

The opposite Schubert variety $Y(u) := \overline{B^- uB/B} \Longleftrightarrow m_{u,w} = \prod_{\substack{\alpha>0 \\ u \le s_\alpha w < w}} \frac{1-q^{-1}e^{\alpha}(\tau)}{1-e^{\alpha}(\tau)}.$

is smooth at the point $wB \in Y(u)$.

Thm (Aluffi - Mihalcea - Schürmann - S, 19).

The conjectures hold.

idea: ① G simply laced,

$P_{u,w}(q)=1 \iff X(w)$ is smooth at $uB \in G/B$.

② $\exists!$ affine Hecke algebra module isomorphism

$$K_T(X) \otimes_{K_T(pt)} \mathbb{C}_\tau \xrightarrow{\sim} I(\tau)$$

s.t. $\{$ dual basis of $MC_y(X(w)^\circ) \} \longleftrightarrow \{ \varphi_w \}$

$\{$ fixed point basis $\} \longleftrightarrow \{ f_w \}$

$\tau \in T$

$K_T(pt) = \mathbb{Z}[T] \xrightarrow{ev_\tau} \mathbb{C}_\tau$

Iwahori-Whittaker functions.

σ – an unramified principal character. of $N^\vee(F)$ $\qquad B^\vee = T^\vee N^\vee$

Whittaker functional:

$$L : \mathrm{Ind}_{B^\vee(F)}^{G^\vee(F)} \tau \longrightarrow \mathbb{C}, \quad \text{s.t.} \quad L(n\phi) = \sigma(n)\cdot L(\phi), \ n \in N^\vee(F).$$

For any $f \in \mathrm{Ind}_{B^\vee(F)}^{G^\vee(F)} \tau$,

define $W_\tau(f) : G^\vee(F) \to \mathbb{C}$

$$g \longmapsto L(g\cdot f).$$

Spherical Whittaker function. $W_{\tau}(\sum_{\omega} \varphi_{\omega}) : G^{\vee}(F) \to \mathbb{C}$.

Thm: (Casselman-Shalika formula.)

μ dominant coweight of $G^{\vee}$, ϖ - uniformizer of $\mathcal{O}_F$

$$W_{\tau^{-1}}(\sum_{\omega} \varphi_{\omega})(\varpi^{-\mu}) = (*) \prod_{\alpha>0} (1-q^{-1}e^{-\alpha}(\tau)) \cdot \chi_{\mu}(\tau).$$

char. of irr. highest weight μ rep. of G.

Remark: $\chi_{\mu} = \chi(G/B^-, \underbrace{G \times_{B^-} \mathbb{C}_{\mu}}_{= \mathcal{L}_{\mu}}) := \sum (-1)^i \, ch_T H^i(G/B^-, \mathcal{L}_{\mu}) \in K_T(pt)$

equivariant Euler character.

Iwahori-Whittaker functions: $\mathcal{W}_\tau(\varphi_w) : G^\vee(F) \to \mathbb{C}$.

Thm: (Mihalcea-S, 19). μ dominant coweight of $G^\vee$,

Segre-type class.

$$\mathcal{W}_{\tau^{-1}}(\varphi_w)(\varpi^{-\mu}) \overset{(*)}{=} \prod_{\alpha>0} (1+y e^{-\alpha}(\tau)) \cdot \chi\left(G/B^-, \mathcal{L}_\mu \otimes \frac{MC_y([B^- w B^- \hookrightarrow G/B^-])}{\lambda_y(G/B^-)} \right)(\tau)$$

Remark: 1) Summing over $w \in W$, we get the Casselman-Shalika formula.

2). proof uses work of Brubaker-Bump-Licata.

3) can also be computed from colored vertex models (Brubaker-Buciumas-Bump-Gustafsson).

Thank you!
